60W PIR LANTERN LIGHT
SLB44-Black/SLW45-White

INSTALLATION & OPERATING INSTRUCTIONS

TIME GUARD LIMITED
In the unlikely event of this product becoming faulty due to defective material or manufacture, within 3 years of the date of purchase, please return it to your supplier with proof of purchase and it will be replaced free of charge.

Should you encounter any difficulty please contact our helpline on 020 8450 0515.

SECTION ONE
GENERAL INFORMATION

The unit utilises passive infrared technology to detect heat radiation of moving human bodies.
During the hours of darkness the unit fully illuminates when it senses movement within its detection field.

PARTS INCLUDED
- Luminaire c/w PIR Sensor unit.
- Accessory Pack.

TOOLS & PARTS NEEDED
- Electric/hand-held drill & bits.
- Terminal or Electricians screwdriver
- Large slotted/philips screwdriver
- Wire cutters

Unit is for outdoor use only. Unit must be mounted on a non-flammable surface as a fixed luminaire, and is not suitable for portable use.
The unit can get very hot during use. Ensure the unit has cooled before handling.
Ensure adequate ventilation space is allowed between the unit and any object above, in front or to either side of the unit. Suggested space is 0.5m above, 0.3m to either side & 1.0m in front. If in any doubt, consult a qualified tradesperson or electrician.

DO NOT USE THIS PRODUCT WITH COMPACT FLUORESCENT ENERGY SAVING LAMPS.

SECTION TWO
SELECTING THE LOCATION

The motion detector has a number of detection zones, at various vertical and horizontal angles as shown (see diagram A).
A moving human body needs to cross/enter one of these zones to activate the sensor. The best all-round coverage is achieved with the unit mounted at the optimum height of 1.8m.

Careful positioning of the sensor will be required to ensure optimum performance. See diagram A detailing detection range and direction.

The sensor is more sensitive to movement ACROSS its field of vision than to movement directly TOWARDS (see diagram B). Therefore position the unit so that the sensor looks ACROSS the likely approach path.
Avoid positioning the sensor where there are any sources of heat in the detection area (extractor fans, tumble dryer exhausts etc.).
Reflective surfaces (ie pools of water or white-painted walls) and overhanging branches may cause false activation under extreme conditions.

During extreme weather conditions the motion sensor may exhibit unusual behaviour. This does not indicate a fault with the sensor. Once normal weather conditions return, the sensor will resume normal operation.
SECTION THREE
INSTALLATION

After choosing a suitable location (see previous section) install the unit as follows:

The unit is suitable for connection to a 230 V ac 50Hz electricity supply. It is suggested that
3-core round flexible cable of 1mm² gauge is used. A isolating switch should be installed to
switch the power to the unit ON & OFF. This allows the sensor to be easily switched off
when not required or for maintenance purposes.

*** IMPORTANT ***
Switch off the electricity at the fuse box by removing the relevant fuse or switching
off the circuit breaker before proceeding with the installation.

Remove the lantern backplate by unscrewing the brass domed nuts. Remove the terminal
block from its mount. Punch through the knockouts in the backplate.

Mark the position of the fitting holes.

Drill the holes. Insert the rawl plugs into the holes.

PIERCE & PASS THE CABLE THROUGH THE GROMMET BEFORE PROCEEDING.

Attach the mounting plate to the wall using suitable screws. Do not overtighten the
mounting screws as this could damage the mounting plate.

Re-affix the terminal block onto the wall mounting plate.
CONNECTION
Connect the cable to the terminal block on the unit as follows (see connection diagram):

- NEUTRAL (Blue)  N
- EARTH (Green/Yellow)
- LIVE (Brown)  L

Ensure that the connections are secure.

Fasten the lantern to the backplate using the domed nuts, ensuring the wiring box seal is correctly in place.
Install the lightbulb (not supplied).
Install the glass panels, ensuring they are seated correctly.
Fit and secure the lantern lid.
SECTION FOUR
OPERATION AND TESTING

WALK TESTING PROCEDURE
The sensor will rotate from left to right. Adjust the sensor to point in the desired direction. Set the two adjustment controls on the rear of the unit (diagram C) to the following positions:

- **DUSK** - Fully clockwise
- **TIME** - Fully anti-clockwise

The unit will now operate during daytime as well as at night, illuminating the lamp at full power for approx. 5 seconds each time. This allows testing to be carried out to establish the best position for the sensor.

The lamp will immediately illuminate at full power as the unit goes through its "warm-up" period. Try to remain outside the detection area during the warm-up period. Walk across the detection area approx 5 metres from the unit. As you cross a detection "zone" the lamp will switch to full power.

Start moving again. As you cross each "zone" the lamp will switch back to full power. Repeat the above, walking at various distances and angles to the unit. This will help you to establish the detection pattern.

SETTING UP FOR AUTOMATIC OPERATION
When walk tests are complete, the unit can be switched to automatic operation:

The **TIME** setting controls how long the unit remains illuminated following activation & after all motion ceases. The minimum time (fully anti-clockwise) is approx. 5 seconds, whilst the maximum time (fully clockwise) is approx. 5 minutes. Set the control to the desired setting between these limits.

The **DUSK** control determines the level of darkness required for the unit to start operating. The setting is best achieved by the procedure below:

Set the **DUSK** control knob fully anti-clockwise. Wait until darkness falls. When the ambient light level reaches the level of darkness at which you wish the lamp to become operative (ie. at dusk), SLOWLY rotate the control in a clockwise direction until a point is reached where the lamp illuminates. Leave the control set at this point.

At this position, the unit should become operative at approximately the same level of darkness each evening. Observe the operation of the unit. If the unit is starting to operate too early (ie. when it is quite light), adjust the control slightly anti-clockwise. If the unit starts to operate too late (ie. only when it is very dark), adjust the control slightly clockwise. Continue to adjust until the unit operates as desired.
### SECTION FIVE
#### TECHNICAL SPECIFICATIONS

<table>

</table>

In the event of the cover glass shattering, do not replace with normal household glass.
Contact the helpline for replacement details.

If you experience problems refer to Troubleshooting Guide.
If problems still exist, do not immediately return the unit to store.

Qualified Customer Support Co-ordinators will be on-line to assist in resolving your query.
## SECTION SIX
### TROUBLESHOOTING GUIDE

#### PROBLEM

- ✔️ Lamp stays ON all the time at night.
- ✔️ PIR keeps activating for no reason / at random.
- ✔️ PIR sensor will not operate at all.
- ✔️ The PIR sensor will not operate at night.
- ✔️ Unit activates during the daytime
- ✔️ PIR coverage is poor/sporadic
- ✔️ Detection range varies from day to day

#### SOLUTION

- The unit may be suffering from false activation. Cover the sensor lens completely with a thick cloth. This will prevent the sensor from "seeing" anything. If the unit now switches off after the set time duration and does not re-activate, this indicates that the problem was caused by false activation. The problem may be solved by slightly adjusting the direction/angle of the sensor head (see previous section).
- You may not be allowing the unit time to complete it’s warm-up period. Stand well out of the detection range and wait (the warm-up period should never exceed 5 minutes). Occasionally, winds may activate the sensor. Sometimes passages between buildings etc. can cause a "wind tunnel" effect. Ensure the unit is not positioned so as to allow detection of cars/people using public thoroughfares adjacent to your property.
- Check that the power is switched ON at the circuit breaker/internal wall switch.
- Turn OFF the power to the unit and check the wiring connections as per the diagram (see previous section 3). Ensure no connections are loose.
- Check the lamp. If the lamp has failed, replace. Ensure that the lamp is seated correctly in the lampholder.
- The level of ambient light in the area may be too bright to allow operation at the current DUSK setting. During the hours of darkness, adjust the DUSK control slowly clockwise until the lamp illuminates. Refer to previous section for more details.
- The level of ambient light in the area may be too dark for the current DUSK setting. During daylight, adjust the DUSK control slightly anti-clockwise. When the lamp load extinguishes, enter the detection area. If the PIR still activates, the setting is still too high. Repeat the above procedure until the PIR does not activate when you enter the detection area. Refer to previous section for more details.
- Unit may be poorly located. See previous section - ‘Selecting The Location’ and re-locate the unit.
- PIR sensors are influenced by climatic conditions. The colder the ambient temperature, the more effective the sensor will be. You may need to make seasonal adjustments to the sensor head position to ensure trouble-free operation all year round.
Remove cover (using a small screwdriver and lift up gently) to reveal adjustment controls.

To replace cover simply line up and click back into position.
