

TIMEGUARD®

Round Pattern 24 Hour Electromechanical Time Controllers with Half Day & Day Omit

Model: RTS113

Model: RTS114

Installation & Operating Instructions

RTS113/RTS114

Round Pattern Electromechanical Timeswitches

1

1.0 Description:

1.1 Application

The RTS113/RTS114 round pattern electromechanical, double insulated time controllers come with a 3 or 4 pin plug-in wireable base. They are compatible with the bases used for the single channel ON/OFF mains linked and voltage free industry standard round pattern timeswitches. Consequently the RTS113/RTS114 can be considered as plug-in service replacements for these units as well as for new installations.

1.2 Features

The timeswitch comes in four forms all driven by quartz controlled stepping motors – the RTS113 with mains linked contacts and the RTS114 with voltage free contacts,.

- Override to next programme change (daily programme only).
- Permanent ON facility.
- Daily operation with half day(s) and day(s) omit.

1.3 Technical Data

Type:	RTS113/RTS114
Type of programme:	Daily with half day(s) and day(s) omitted over a 7 day period if required
Operating voltage:	220-240V AC 50Hz
*Switching capacity:	20A, 240V~ for resistive loads
Contact material:	Hard silver
Type of contact:	ON/OFF mains linked RTS113, voltage free RTS114
Time base:	Quartz
Operating accuracy:	$\leq \pm 1$ sec./day at 23°C
Min. switching interval:	30 min, which can be increased in 15 minute steps.
Max. no. of switchings:	48 (in a 24 hour period)
Ambient temp. range:	-10 to 40°C
Class of shock protection:	Class 2
Dirt and moisture protection:	IP20
Conforms to directives:	Conforms to latest directives
Control type:	1B
Cable capacity:	1 x 6mm, 2 x 4mm, 3 x 2.5mm. 1mm and 1.5mm can also be used but it is recommended these are folded back

*For all other loads please contact Timeguard on 020 8450 0515

1.4 Dimensions

2.0 Installation Instructions:

2.1 Safety Information

The RTS113/RTS114 should only be installed by a trained electrician.

The I.E.E. wiring regulations must be observed. The supply must be disconnected before wiring commences and a means of isolation with a separation of 3mm in each current path must be provided in the supply to the RTS unit. This product must not be installed where it may come into direct contact with liquids. The RTS unit is suitable for fixed wiring applications only.

2.2 Electrical Interference

Despite elaborate safety precautions, exceptionally strong electrical fields may interfere with any electronically controlled timeswitch. We therefore recommend that you observe the following points before installation:

- Suppress interference caused by inductive loads by means of an RC filter and/or varistor (VDR).
- Do not install the RTS unit in close proximity to sources of interference, e.g. transformers, contactors, Pcs and TV sets.

2.4 Installation

Three fixing holes B countersunk with central knock out

Lug D on cover

Lug C on base

Fig 2

Three cable holes leading to terminals 1, 2 and 3 (terminal cover removed)

Fig 4a RTS113

Fixing screw A for terminal cover which also retains the plug-in timeswitch assembly

Transparent cover

Base

Terminal cover

4 cable/conduit knock outs in terminal cover (2 at the bottom, 1 at each side)

Fig 3

Three cable holes leading to terminals 1, 2 and 3 (terminal cover removed)

Fig 4b RTS114

Remove the transparent cover from the RTS unit by rotating it anticlockwise through 30° and then pulling it clear. Unscrew the screw A (see fig. 3), remove the terminal cover and pull the timeswitch plug-in assembly clear of the base. Drill out the three fixing screw holes in the base (see fig. 2) and use 3 x No. 8 woods crews (with wall plugs if necessary) to fix the RTS unit to the mounting surface. Alternatively the unit may be fixed to panelling using 2B.A. or 5mm screws but if the panelling is conducting it must be adequately earthed in accordance with the I.E.E. wiring regulations. In either case ensure that the screws are countersunk and tightened fully so that there is no projection above the surface of the base. Strip 8mm of insulation from the end of each wire and insert in the appropriate terminal (see figures 1 and 4). Securely tighten the terminal screws onto the wires and push the timeswitch plug-in assembly fully home into the base to ensure electrical safety. Remove the appropriate knock-outs in the terminal cover and locate the cover over the cables or conduit, securing with screw A. After commissioning the installation replace the transparent cover by pushing over the base and rotating clockwise ensuring that lugs C and D on the base and cover are lined up as in fig. 2.

If the transparent cover is required to be locked this can be achieved by a padlock through the lug C with lugs C and D in the position shown in fig. 2. Alternatively the holes in lugs C and D can be lined up, wired and sealed. The fixing screw A (fig. 3) securing the terminal cover can also be secured by wiring and sealing.

3.0 Programming:

3.1 24 hour programming and clock time/day of week setting.

Insert red tappets into the programme ring to set the required ON times and the blue tappets to set the required OFF times (see examples in fig. 5). Up to 24 complete ON/OFF programmes can be set over a 24 hour period.

The correct day of the week (Wed) can now be set by referring to fig. 5 and rotating the 24 hour programme ring in a clockwise direction until the first digit of the appropriate half day marker e.g.  2 (Wed AM 1st digit 2) is opposite the time marker. The correct clock time (1500 hours – see fig. 5) can now be set by continuing to rotate the ring in a clockwise direction until the appropriate marker on the 24 hour ring is above the time marker.

The condition of the red (24 hour) control now needs to be checked and changed if necessary by turning the red control shaft in an anticlockwise direction using a small screwdriver. If the last tappet on the 24 hour ring to pass the time marker in a clockwise direction is blue the slot in the red control shaft needs to be aligned with any ● symbol (OFF) and any ■ symbol (ON) if the last tappet is red.

Next ensure that all the seven day segments have their screwdriver slots parallel to the 7 day ring () If not, turn in a clockwise direction with a small screwdriver until they are. **Note: Excess force used to turn a segment in an anticlockwise direction will damage the timeswitch.**

Finally set the 7 day (blue) output control to ON if necessary by turning the blue control shaft with a small screwdriver in a clockwise direction until the screwdriver slot in the shaft is aligned with any ■ symbol. Finally ensure permanent override indicator is set to AUTO. The RTS113/RTS113Q is now ready for service as a 24 hour timeswitch.

Note: Excess force used to rotate the programme ring and the blue control shaft in an anticlockwise direction or the red control shaft in a clockwise direction will damage the timeswitch.

Fig 5

3.2 Half day and day omit programming and 7 day control setting.

This is required only if the programme set on the 24 hour ring is not needed for one or more half days. An example is shown in fig. 5 where the requirement is to have no operation on Thursday (day 4) afternoon and all day Friday (day 5). The 7 day switch segments between 4 and 4 (midday Thursday) as well as between 5 and 6 (midnight Friday) have been turned anti-clockwise with a small screwdriver until the segment slot is aligned radially (☉) so that the 7 day output will be changed as each of these segments passes the time marker.

Excessive force used to turn a segment anticlockwise will cause damage.

The 7 day (blue) output will also need to be set manually in the right initial condition. In the example shown in fig. 5 when the time marker points within the period midday Thursday – to midnight Friday the setting will be ● – OFF and outside this time period ■ – ON. This is achieved by using a screwdriver to turn the 7 day control in a clockwise direction until the slot points to a ● for OFF or a ■ for ON. In the situation shown in fig. 5 the control needs to be set ON. Finally ensure permanent override indicator is set to AUTO. **The 7 day control must only be rotated in a clockwise direction. The screwdriver slot in the control is shaped to prevent rotation in the opposite direction.**

3.3 Override to next programme change.

The red 24 hour control can be turned anticlockwise by one click. This will change the present output of the RTS unit and will last until the next programme change.

The 7 day control must only be rotated in a clockwise direction. The screwdriver slot in the control is shaped to prevent rotation in the opposite direction.

3.4 Permanent Override ON.

The RTS unit can be permanently overridden ON by pressing the red button on the outside of the case and transparent cover adjacent to the 7 day and 24 hour controls. The override can be terminated by pressing the button again. The state of the timeswitch either permanently ON or in Auto is indicated by the pointer adjacent to the 7 day and 24 hour controls.

3.5 Programming Overview

Fig 6

Note: all other 7 day ring segments are in the no change orientation and are not shown for clarity

6

24 Hour Ring

Red tappet for ON operation.

Blue tappet for OFF operation.

Fig 2 shows an ON period starting at 1200 and ending at 1500.

24 Hour Control

If last tappet past time marker was blue 24 hour control should show ● (OFF) and ■ (ON) if it was red.

7 Day Ring

Segments with screwdriver slots positioned radially cause a change on the 7 day control.

The 7 day contacts are in series with the 24 hour contacts controlling the timeswitch output, so the 7 day contacts need to be closed (■ – ON) for the 24 hour contacts to be operational.

Finally ensure permanent override indicator is set to AUTO.

4.0 5 Year Guarantee

In the unlikely event of this product becoming faulty, due to defective material or manufacture, within 5 years of the date of purchase, please return it to your supplier with proof of purchase and it will be replaced free of charge. **Should you encounter any difficulty please contact our helpline on 020 8450 0515.**

5.0 Additional Tappets

4 red and 4 blue tappets are supplied with the RTS unit. If further tappets are required they may be obtained from Timeguard quoting the numbers 934 3 311 BLUE, 934 3 035 RED. Please ring 020 8450 0515.
